

Sophos Endpoint Patch Add-on

Take the guesswork and uncertainty out of patching

90% of vulnerabilities can be patched. Yet, many computers remain at risk because patching is hard. IT Managers don't know which patches are needed, and they're not confident their computers are patched.

With our Endpoint Patch Add-on we prioritize the most critical patches for you by tying them to the threats they prevent. You can be confident in your security because our patch assessment identifies, prioritizes and scans for critical threat-related patches. And it's part of the complete security of our Endpoint Protection 10 all delivered in one deployment from a single console.

Coming in Endpoint 10:

Reduce your risk of infection

One simple scan finds un-patched computers helping you fix vulnerabilities and keep your data and network safe.

Scan for application and OS patches

We scan for patches for widely-used products from Adobe, Apple, Citrix, Microsoft, Skype and more.

Prioritized patches tied to threats

Our SophosLabs rates patches - critical, high, medium and low – and we tell you which threats a patch prevents so you can easily identify the most important patches.

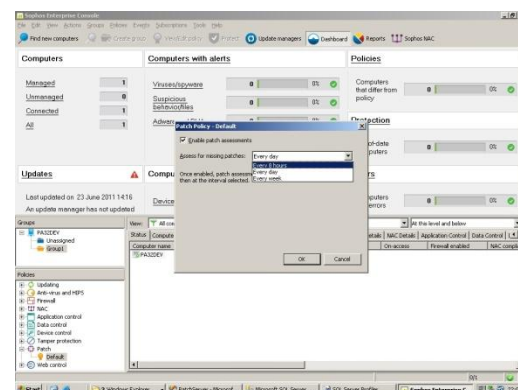

Know your patch status with certainty

Right within our Endpoint Console you can create patch assessment policies, setup alerts, and reporting. Simple!

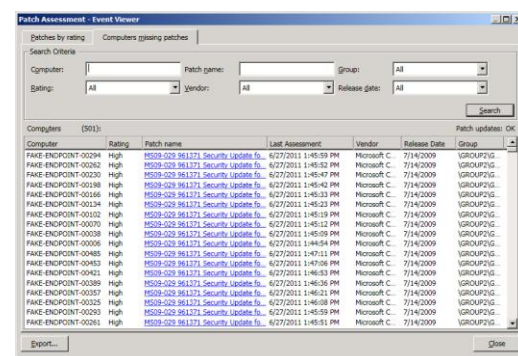

No added deployment

Best of all - it's all integrated. No separate deployment or console is required.
